

Web Scraping Using Python

Web scraping is a method used to collect information from websites automatically. In this task, Python is used to access a website and extract some basic information from it. The program sends a request to the website and receives its HTML content.

After getting the webpage data , the program searches for the title of the webpage and some links available on the site. This helps in understanding how data can be extracted from websites using Python.

This task shows a simple example of how web scraping works and how useful information can be collected from websites automatically.
